## **OXIDATIVE STRESS AND INFLAMMATION**

Oxidation is a chemical reaction where oxygen reacts with substances. Common examples include <u>fire</u> , <u>browning</u> , or <u>rust or copper turning green</u> .
In an oxidation reaction the molecule loses an <u>electron</u>
A free radical is a molecule that is missing an <u>electron</u> .  It sets up a chain reaction by stealing an <u>electron</u> from another molecule causing it to become a <u>free</u> <u>radical</u> .
Free radicals damage the body's <u>DNA</u> .
Sources of free radicals include:
metabolism , UV light , ionizing radiation ,
smoking , environmental pollution , inflammation
An <u>antioxidant</u> can stop the free radical cascade.
Oxidative stress occurs in diabetes when <u>blood</u> <u>sugar</u> and <u>insulin</u> levels are uncontrolled.
Oxidative stress is characterized by the <u>overproduction</u> of free radicals. This results in the body <u>aging</u> five times faster than the general population.
Oxidative stress causes <u>inflammation</u> .
Inflammation comes before diabetes and begins as oxidative stress in the <u>fat</u> <u>cells</u> .

To reduce oxidative stress we need to decrease our exposure to free radicals. Some sources we can control exposure to include:

<u>Cigarette smoking</u>, <u>Environmental pollutants</u>, <u>Pesticides</u>, <u>Super-heated oils</u>, <u>Meats</u>.

Antioxidants help reduce oxidative stress by <u>neutralizing</u> free radicals.

Antioxidants are mainly present only in <u>plant</u> foods.

To deal with BARRIERS to your health goals you should:

- *Identify* the barriers
- Select one to work on
- Brainstorm for ways to remove the barrier
- Select your OPPORTUNITY TO IMPROVE
- Carry out your plan
